

IN THE CLAIMS:

Please cancel claims 7 and 17.

Please amend claims 1, 6, and as follows

1. (Amended Twice) A method for dithering color in a graphics system that displays a group of pixels and wherein the color of the pixels is represented by color shades having fewer than eight bits, the method comprising the steps of:
- (a) generating an eight bit color shade value for each pixel representing a desired color for each pixel;
  - (b) truncating the desired eight bit color shade value to obtain a truncated color shade value;
  - (c) generating a FRAC value for each pixel from the truncated bits of said eight bit color shade value;
  - (d) producing a ramp value for each pixel using said FRAC value to select one from a group of plurality of ramp values having different probabilities reflecting proximity to the truncated color shade value, wherein said ramp value encodes a discrepancy between the desired eight bit color shade value and the truncated color shade value and includes a number of logic one values indicative of said discrepancy between the desired eight bit color shade value and the truncated color shade value; and
  - (e) using a bit from said ramp value to select a color shade value of fewer than eight bits that determines the color of each pixel.

1 2. (Unchanged) The method of claim 1, wherein said truncated bits in step (c) includes fewer  
2 than the two least significant bits of said desired eight bit color shade value.

1 3. (Unchanged) The method of claim 2, wherein the truncated bits includes the three least  
2 significant bits of said desired eight bit color shade value.

1 4. (Unchanged) The method of claim 2, wherein the step of using a bit from said ramp value  
2 to select a color shade value of fewer than eight bits (step e) includes using a value from a look-up  
3 table to select said bit from said ramp value.

1 5. (Unchanged) The method of claim 4, wherein each pixel has an x address and a y address  
2 and said value from said look-up table is determined from the x address and the y address of the  
3 pixel to be rendered.

1 6. (Amended Twice) A method for dithering pixel color in a graphics system that displays a  
2 group of pixels in which primary pixel colors are represented by color shades having fewer than  
3 eight bits comprising the steps of:

4 (a) generating an eight bit color shade value for each pixel representing a desired color for  
5 each pixel;

6 (b) truncating the desired eight bit color shade value to produce a first color shade value  
7 comprising fewer than eight bits;

8 (c) generating a FRAC value for each pixel representing the truncated bits of said desired  
9 eight bit color shade value;

10 (d) producing a ramp value for each pixel using said FRAC value to select one from a  
11 group of plurality of ramp values having different probabilities reflecting  
12 proximity to the truncated color shade value, wherein said ramp value encodes a  
13 discrepancy between the desired eight bit color shade value and the first color  
14 shade value and includes a number of logic one values indicative of said  
15 discrepancy between the desired eight bit color shade value and the first color shade  
16 value;  
17 (e) producing an addend value for incrementing said first color shade value;  
18 (f) incrementing said first color shade value by said addend value to produce a second  
19 color shade value; and  
20 (g) selecting said first color shade value or said second color shade value to determine the  
21 color of each pixel in said group of pixels.

1 7. (Canceled) The method of claim 6, wherein said step of producing a ramp value (step d)  
2 includes producing a ramp value that includes a number of logic one values indicative of said  
3 discrepancy between the desired eight bit color shade value and the first color shade value.

1 8. (Unchanged) The method of claim 6, wherein said step of selecting said first color shade  
2 value or said second color shade value (step g) is performed in response to the state of a bit from  
3 said ramp value.

1 9. (Unchanged) The method of claim 8, wherein each pixel has an x address and a y address  
2 and said x address and said y address of a pixel to be rendered are used to obtain a value from a  
3 look-up table, said look-up table value used to select said bit from said ramp value.

- 1 10. (Unchanged) The method of claim 6, wherein said step of incrementing said first color  
2 shade (step f) produces an overflow signal if an overflow condition is present.
- 1 11. (Unchanged) The method of claim 10, wherein said step of selecting said first color shade  
2 value or said second color shade value (step g) is performed in response to said overflow signal.
- 1 12. (Amended Twice) A graphics system that displays color shades based upon binary  
2 representation having fewer than eight bits, wherein said graphics system initially receives a desired  
3 eight bit binary representation for each color shade that is used by the graphics system to render  
4 pixels in a pixel grid, said desired eight bit binary representation including upper order bits and  
5 lower order bits, comprising:  
6 select fractional logic that receives the desired eight bit binary representation and wherein  
7 said select fractional logic produces on its output lines the lower order bits of said  
8 desired eight bit binary representation value;  
9 a look-up table that produces a control value based upon an address of each pixel; and  
10 ramp probability logic coupled to said select fractional logic and said look-up table, said  
11 ramp probability logic producing a ramp value using output from said select  
12 fractional logic to select one from a group of plurality of ramp values having  
13 different probabilities reflecting proximity to a color shade having a binary  
14 representation fewer than eight bits, said ramp value encoding a discrepancy  
15 between said desired eight bit binary representation and said binary  
16 representations having fewer than eight bits and includes a number of logic 1

17                   values indicative of the discrepancy between said desired eight bit binary  
18                   representation and said binary representations having fewer than eight bits.

1    13.    (Unchanged) The graphics system of claim 12, further including an addend generator that  
2    produces an addend value for incrementing said binary representations having fewer than eight bits.

1    14.    (Unchanged) The graphics system of claim 13, further including add logic for producing  
2    the sum of said addend value and said binary representations having fewer than eight bits.

1    15.    (Unchanged) The graphics system of claim 14, further including a first multiplexer for  
2    selecting a bit from said RAMP value, and wherein the bit selection is controlled by said control  
3    value produced from said look-up table.

1    16.    (Unchanged) The graphics system of claim 15, further including a second multiplexer to  
2    which said binary representation having fewer than eight bits and said sum are provided as input  
3    signals, and wherein said second multiplexer selects one of a said input signals, said input signal  
4    selection controlled by a control signal and said control signal determined by said ramp value.

1    17.    (Canceled) The graphics system of claim 12, wherein said ramp value includes a number of  
2    logic 1 values indicative of the discrepancy between said desired eight bit binary representation and  
3    said binary representations having fewer than eight bits.

1    18.    (Unchanged) The graphics system of claim 17, wherein said graphics system represents  
2    color using five bits for red and five bits for blue.

1    19.    (Unchanged) The graphics system of claim 18, wherein said graphics system represents  
2    color using six bits for green.

1 20. (Unchanged) The graphics system of claim 15, wherein said add logic produces an  
2 overflow output signal upon detection of an overflow condition.

1 21. (Unchanged) The graphics system of claim 20, wherein said control signal is also  
2 determined by said overflow signal.
